

Week 16 — The Graduation Page

=====

CERTIFICATE OF COMPLETION

This certifies that _____

S P E A K S M A T L A B

16 weeks · 1 language · 1 text adventure shipped

=====

The whole course — check every box you've earned (hint: all of them)

- [] I can make a computer **display** anything — and read its error messages like clues (*week 1*)
- [] I can store values in **variables** — and watch the Workspace like a pro (*week 2*)
- [] I can **ask the user questions** and build sentences with `fprintf` (*week 3*)
- [] I can make a program **decide** with `if/elseif/else` (*week 4*)
- [] I can roll dice and flip coins with **randi** (*week 5*)
- [] I can make a computer do something 1,000 times with a **for loop** (*week 6*)
- [] I can keep a game alive with a **while loop** (*week 7*)
- [] I can take **text apart** — counting from 1, letters as secret numbers (*week 8*)
- [] I can **encrypt a secret message** (and crack one) (*week 9*)
- [] I can invent my own commands with **functions** — one machine per file (*week 10*)
- [] I can **draw geometry with code** — polygons, spirals, art (*weeks 11-12*)
- [] I can **simulate** thousands of experiments — and measure π with rain (*weeks 13-14*)
- [] I helped **design and ship a real game** (*weeks 15-16*)

Where to go next — all free

Resource	What it is
MATLAB Onramp (matlabacademy.mathworks.com)	the official free interactive MATLAB course, in the browser — the natural next step: it starts right where this class ends
GNU Octave (octave.org)	a free program that runs MATLAB code — install it at home and every file from this course works, including the class game
code.org & Hour of Code	free guided projects, from beginner to wild
Scratch (scratch.mit.edu)	drag-and-drop coding — great for building games fast, and a fun challenge: rebuild the class adventure in it
Python	a friendly second language when you're ready — most ideas from this course (variables, ifs, loops, functions) transfer straight across

Ask your teacher for this course's files — everything in them, you learned. (Including the python-version of the course, when you're ready for language #2.)

The final brain teaser (take it home — you've earned it)

Week 1, you programmed a human to make a sandwich. Now close the circle: teach someone at home to program *YOU* making a sandwich. They give the instructions; you follow them *exactly* — literally, mercilessly, like the machine you now understand. When it goes hilariously wrong, teach them what you'd teach a computer: *be precise, go in order, and when something breaks — read the error, fix one step, run it again.*

That's programming. You speak it now. Class of _____, dismissed. 🎉
