

Week 1 — What Is a Program?

Name: ____ Date: ____

A **program** is a list of exact instructions a computer follows, in order.

Today's words

Word	What it means
program	a list of instructions the computer follows, in order, exactly
code	the written-out instructions
print()	the command that displays something on the screen
string	text in quotes — the computer repeats it without doing math
bug / error	a mistake in code; the computer points at it with a message

1 • Be the computer 🤖

You are the computer. Follow the code *exactly* and write what the screen would show.

```
print("Welcome!")  
print(3 + 4)  
print("3 + 4")
```

The screen shows:

Line 1: ____
Line 2: ____
Line 3: ____

2 • Spot the bug 🐛

Each line has **one** mistake. Circle it.

```
1. Print("hello")  
2. print("hello")  
3. print(hello there)
```

3 • True or false?

Circle one for each:

- The computer can rearrange your instructions into a better order. **T / F**
- `print(2 + 2)` and `print("2 + 2")` show the same thing. **T / F**
- An error message means the computer is telling you where it got stuck. **T / F**

🧠 Brain teaser (optional — take it home)

Program a human! Write instructions for drawing a simple house (square + triangle roof + door) so *exact* that someone who has never seen a house could follow them and get it right. Rules:

- Number each step.
- Each step can only be: draw a straight line, or move your pencil without drawing.
- You may use words like up/down/left/right and lengths in centimeters.

Test it on a family member — they must follow it *literally*, like the sandwich robot. Bring your program (and their drawing!) next week for a shout-out.
